

# This Just In

Nobody asked but ...

Of course the climate changes. If it didn't, it would be nothing at all. Of course humans affect climate change. We eat, sleep, move, mate, defecate — did we think those were processes that have no input, no output, and no by product? Temperature will quit changing when everything else on Earth becomes static. Of course, temperature seems on the rise to our metric schemes. We measure temperatures where we are — in cities in particular. Did we think we could go from mostly rural to mostly urban with no other change? Do we think the current trend will never alter?

— Kilgore Forelle
